STATE OF MARKETS

September 2026

Important Disclosures

This presentation is provided for informational purposes only. Furthermore, this content is not investment advice, nor is it intended for use by any investors or prospective investors in any a16z funds. This presentation may link to other websites or contain other information obtained from third-party sources - a16z has not independently verified nor makes any representations about the current or enduring accuracy of such information. Any investments or portfolio companies mentioned, referred to, or described are not representative of all investments in vehicles managed by a16z; visit <https://a16z.com/investment-list/> for a full list of investments. Other important information can be found at a16z.com/disclosures.

Any segmentation of market performance or financials for tech and non-tech is for illustrative purposes only. The tech universe of companies was designed to capture publicly traded technology companies identified through third-party industry classifications and other publicly available information. Industry classifications are not standardized, and thus the universe may not be exhaustive, and companies may reasonably be included, excluded or categorized differently by other lists or indexes. The company list is available upon request. Performance data and consensus estimates are sourced from S&P Capital IQ, as of the date indicated.

Tech Is The Everything Cycle

Tech Is The Everything Cycle

Tech has gone from a “cottage industry” to the prime mover in the global economy. At this point, every company is, in some sense, a tech company—you’d be hard-pressed to find a truly pen n’ paper business.

More than any other sector, tech is driving investment, R&D cycles, earnings growth and margin expansion. The largest, most profitable, and fastest-growing companies the world has ever known, are tech companies. The AI infrastructure buildout alone is responsible for all or nearly all of net-new construction spending, blue collar job-growth, durable goods imports, net-new IG-issuance, etc. AI infra is arguably the only pro-cyclical impulse firing in the economy right now.

The point is that tech has left the cottage. Tech is the Everything Cycle now, and it’s not looking back.

Tech Is Now 55% of All U.S. Capital Spending

High-tech share of capital spending in nominal GDP (percent)

A16ZGROWTH

The Market Is Not a Mag-Whatever Story, Anymore

Last year, performance and returns was a concentrated story: the Mag 7 dominated the field.

This year, the field has raced ahead, while the biggest tech companies have lagged the indexes. The most straightforward explanation for the shift is unpacked in the next section: hyperscalers are pouring their profits into the AI buildout.

Hyperscaler spending has been driving semiconductor earnings to unprecedented heights, and market returns have followed the money.

Rest Of Tech, Not Mag 7, Has Carried The Year

Indexed performance, ytd

A16ZGROWTH

Debt Markets Step In (On and Off Balance Sheet)

With hyperscaler cash fully-tapped, credit markets have sprung to life. Lending to Uncle Sam is no longer the only game in town.

Borrowing Bigly For The Build Out

Hyperscalers and Nvidia new IG debt and SPVs

Source: Bloomberg, JPMAM, August 31, 2026

AI6ZGROWTH

AI Borrowing Is Longer Term Commitment

Net duration supplied to US market, change in the stock of 10-year equivalents over 12 months, \$bn. Monthly. Treasury is net of SOMA and of buybacks.

Source: Brian Setser, TreasuryDirect auction history, NY Fed SOMA holdings, Fiscal Data buybacks, Bloomberg, as of 9.25.26.

AI6ZGROWTH

Hyperscaler ROE Still Higher Than Their Cost of Borrowing

Debt certainly raises the stakes, and the numbers are big, but what ultimately matters is the return on investment. For now, hyperscaler ROIC is well-above their cost of borrowing.

These are (again) historically profitable companies, which until recently, borrowed very little. They are borrowing to invest in hard assets that are generating steady (and rising) cashflows. It's a combination that lenders know and love.

Hyperscaler ROIC Is Above Their Cost Of Borrowing

Returns on invested capital (ROIC), cost of debt and weighted average cost of capital (WACC)

A16ZGROWTH

Capex Is Having A Positive Impact On The Broader Economy

The AI buildout has led to a run on skilled labor, with a big premium to hard hat wages.

Data Centers Have Caused A Surge In Construction And Skilled Trades Hiring. And Demand Is Accelerating

Construction employment in data center-exposed categories has increased by more than 300k

Source: US Bureau of Labor Statistics, Haver Analytics, Goldman Sachs Global Investment Research (9/1/26)

AI6ZGROWTH

Data Centers Pay Premium Wages

Median posted pay for data center vs. non-data center postings with the same job title, Jan-Jun 2026.

Source: Indeed, August 19, 2026, not seasonally adjusted. Median posted base pay on US employer postings, Jan-Jun 2026, among postings outside Installation & Maintenance that disclose pay. Data center postings are compared with non-data center postings carrying the same normalized job title and the same pay basis. Titles need more than 50 postings on each side to be shown.

AI6ZGROWTH

Surprise! Data Centers May Be Lowering Your Electricity Bill

Electricity costs, too, have come down due to economies of scale: a large, steady source of electricity demand covers an outsized share of the grid's fixed costs, easing the burden on ratepayers.

The Largest Increases in Electricity Prices Came with the Largest Decreases In Demand

Load growth v. Price Change (2019-25).

Notes: City Journal (July 14, 2026) Chart adapted from R. Wiser et al., "Retail Electricity Price Trends and Drivers: Data Update-2026 Edition," Lawrence Berkeley National Laboratory and The Brattle Group, April 2026 Price changes in cents/kWh, inflation adjusted to 2025\$. Load growth is percent change in retail sales

A16ZGROWTH

"We estimate for every 10% increase in data center capacity average residential retail prices fell by approximately 0.4% on average . . . The result is interpreted thus: from 2019 to 2024 the average residential customer lived in a state where data center capacity grew 160%, which caused their rates to fall by 6%."

Have Data Centers Raised Your Electric Bill?

Reports Of GPU Obsolescence Are Greatly Exaggerated

Every new generation of chips was supposed to render the older generations obsolete, the bears claimed. “The depreciation schedules keep getting longer—what is this chicanery?!” they howled.

It turns out that depreciation schedules might not be long enough. As demand for compute keeps accelerating, GPU rental prices and residual values keep climbing and/or holding steady, even for the oldest generation of chips.

It’s not chicanery, so much as simple unit economics, that have made all this capital allocation look pretty smart, thus far.

Reports Of Obsolescence Greatly Exaggerated: GPUs Getting More Valuable Over Time

GPU residual value, inferred from rental rates

Source: Silicon Data (9.7.26)

A16ZGROWTH

Despite All The Demand, It's Still So Early

AI adoption is broad and impactful, but still relatively shallow.

Copilot Revenue & Seats

“...GitHub Copilot... Copilot revenue accelerated over 60% quarter-over-quarter.”

“...We now have over 30 million paid Microsoft 365 Copilot Seats...”

Satya Nadella, Chairman and CEO, Microsoft, Q4 FY26, July 2026

AI Shopping

“The number of customers using Sparky is up 70% from last year...”

“...Customers and members who use Sparky for shopping spend 40% more per order than other who don't.”

John Furner, President and CEO, Walmart, Q2 FY27, August 2026

Enterprise AI Spending Has Plenty of Room-to-Run

Most companies are not cost-constrained, and intend to spend more on AI.

In the big scheme of things, AI spend is a tiny share of the overall cost stack.

Consider that cloud reached ~4% of IT budgets in Year 2. Most estimates of AI spend are below that, and TAM for AI is considerably larger than IT budgets.

Only 20% Of Orgs Cite Cost As A Constraint

AI6ZGROWTH

More Signs That We're Still Early: Beneath the Surface, AI Is Not Normal

The impressive aggregate picture actually obscures what is going on beneath the surface: adoption is wide, but mostly shallow (for now).

Growth is driven by a tiny share of power-users, who are unlocking more value with increasingly sophisticated tools and implementations.

As the cost of intelligence falls, demand continues to increase for both frontier and non-frontier models. Agents especially are driving parabolic growth in token demand, as routing, caching, and other efficiency gains, make them economically viable. It's Jevons Paradox in real-time.

The exponential increase in demand is driving the price of compute upwards—even 4-5 yo GPUs cost roughly the same as they did a year ago.

And all of this is driven by just the top 1% of users, who are only beginning to scratch the surface of what's possible. Eventually, the rest of the market will catch on (or else be left behind).

AI Natives Generate More Revenues At The Tail

Revenues by quantile

Source: openrouter.ai/rankings

AI&ZGROWTH

Agents Are Caching In

Over 85% of agentic token burn comes from the cached prompt

Source: openrouter.ai, Jan. 5-Aug. 16, 2026

AI&ZGROWTH

Instead of Open v. Closed, Why Not Both?

Cheaper intelligence is expanding the surface area of demand, which means that model competition is not a zero-sum-game.

To the contrary, tiered performance and pricing is giving firms more opportunities to unlock use-cases, up and down the value chain.

In the bigger scheme of things, open-weight tokens are increasing share, but overall token spend is increasing, as well, with frontier models still capturing a premium for frontier problems.

Open Models Growing Quickly (But Still A Tiny Slice Of The Overall Spending Pie)

Spending on China-based open models via AWS, Azure, GCP

Source: YipitData (8.28.26)

AI6ZGROWTH

Atoms Are So Back

AI has led to a broader rotation from bits to atoms

Follow The Money

Returning to markets, all of this AI supply and demand, has had a profound impact on the types of businesses that are driving performance. For more than a decade, software was the star of the show, but with the advent of AI, hardware has taken center stage.

The multi-trillion capex super-cycle has caused a surge in demand for, among other things, GPUs, HBM memory, power components, skilled trades, and even copper, that has far outstripped supply. The result has been historic earnings growth for traditionally sleepy, cyclical sectors, and stock prices have responded, accordingly.

To be clear, it's not only AI-infra driving the rotation from Bits to Atoms. EVs and solar power have also precipitated a massive grid glow-up. Defense spending is on the rise. Rockets and robots are both emerging new frontiers. Global politics and secular aging have lent urgency to the task of rebuilding an industrial base that will support core manufacturing, innovation, and automation.

We've entered a new cycle of real assets, and while tech is running through all of it, capital-light bits is no longer the (only) name of the game. Another Age of Atoms has arrived.

A16ZGROWTH

The Rotation To Atoms Has Flipped The Field In Markets

Unsurprisingly, this great leap forward in Atoms investment is showing up in market pricing. After a decade-long of capital-light dominance, capital-heavy businesses have flipped-the-field.

It's not that capital-light businesses (like software) have performed poorly (SaaSocalypse notwithstanding), so much as tech's largest and most profitable companies—and thereby the world's largest and most profitable companies—are pouring those profits into hardware like never before.

The net result is the AI Supply Chain has been the winning trade, thus far. That's the chipmakers, the optical interconnectors, the turbine shippers, the liquid coolers, and everything in between.

AIGZGROWTH

What If Semis Are Still Cheap?

The funny thing is, though, that as stellar as market performance has been, there's an argument that it hasn't been stellar enough. Forward earnings multiples for some of the largest chipmakers, are well-below what the sky high expectations for earnings growth would normally predict.

There too the reason is fairly straightforward: demand is highly contingent on hyperscaler capex, and seasoned investors in cyclical are always wary of the cycle's peak.

It's also true that necessity is the mother of invention, and with great profit margins, one can expect great efficiency gains for power, compute and memory, right around the corner.

A Narrow Chip Cycle: Earnings Are Growing More Quickly Than Broader Manufacturing Activity

SP500 companies with positive fwd EPS grow v. ISM manufacturing PMI

Source: FactSet, Bloomberg, JPMAM, August 2026

A16ZGROWTH

But capex shows no indication of a slowdown any time soon, and if demand for intelligence is indeed infinite, then this cycle may not be like the other cycles.

Big Discounts on Big Chipmakers?

Calendarized consensus EPS growth v. NTM P/E

Source: S&P Global / Capital IQ, As of 8/14/26, internal calculations. Note: Calendarized EPS growth compares CY2027 with CY2026 using normalized actuals and consensus estimates across differing fiscal year ends. Adjacent non-semiconductor companies included are WDC, SNDK and STX (storage hardware) and CDNS and SNPS (software / EDA). Consensus estimates are aggregated by CapIQ and do not reflect a 16x analysis.

A16ZGROWTH

If that's the case, then future investors are going to have a hard time looking back on those multiples . . . between all the tears, that is.

The Semi Supply Chain Remains Backlogged

Whatever skepticism may preside, ~3 years into the buildout, supply is still lagging demand.

Somehow the GPUs keep arriving on time, but every other piece of the supply chain continues to have unusually long lead-times.

And even if you can get your chips, it's an open question if you can power them up.

Buildout Backlog: At Least The GPUs Are Timely

Chips are one-time, but making the chips and powering them up, is a different story

Source: TrendForce component lead-time tracker, Sep 14, 2026; trade trackers report longer effective waits: DRAM allocation 40+ wks; nearline HDD ~2 yrs; advanced packaging reports: CoWoS / flip-chip and HBM lead times exceeding 52 wks in 2026; TrendForce optics research • Lumentum, Coherent, IQE earnings calls (Aug-Sep 2026); EML lasers quoted at 52+ wks; range inferred, no published module lead time; electrical equipment trackers (Terrapin, DistroForge): transformers ~128 wks avg, large units 3-5 yrs; GE Vernova Q2 2026 earnings call: heavy-duty turbines ordered today deliver ~2031; 116 GW backlog.

SaaSpocalypse?

More Like Software's Selective Selloff,
As SaaS Enters a 'Prove-It' Era

More Prove-It Than Pocalypse

The flipside of hardware's outperformance, has been software's relative malaise. 2026 began with the SaaSocalypse: a seemingly undifferentiated sell-off of formally high-flying public SaaScos, as AI prepared to eat their collective lunch.

What's transpired, however, is better described as "prove it," than -pocalypse.

SaaS has re-rated (gradually, and then suddenly) to reflect the industry's broader shift from growth to profitability. As the share of high-growth, less-profitable companies has given way to slower-growth, more-profitable companies, multiples have compressed accordingly. At the same time, if you're still a high-flyer, your multiples are still pretty, pretty good.

Likewise, AI has certainly raised some doubts about defensibility and terminal value, but not uniformly. Companies with perceived (and/or demonstrated) defensibility and/or AI tailwinds, have outperformed. Cyber and observability has been a standout category, and vertical saas has experienced less compression than horizontal.

Regardless of market-pricing, and the disruption that AI may or may not bring, it remains the case that the underlying *fundamentals* for SaaS has been remarkably stable thus far. Both revenue growth and operating leverage have showed little signs of deterioration (yet), even if they're not quite as impressive as before.

Fundamentals Have Been Stronger Than Returns (Especially For Software)

It's A Brave New World For Startups, Too

Adjusting To Life After ZIRP

Not unlike Public Cos, when ZIRP ended, startups traded growth for profitability.

That said, raising fresh equity tends to require rapid growth. The companies who have successfully raised recently are still growing at a pace in-line (or faster) with peak-ZIRP.

Startups Trade Growth For Profitability (Except The Ones Raising)

Median revenue growth and profit margin, by sector '22-'26

A16ZGROWTH

Everything Is AI Computerse

This cycle is not like the previous ones

Concentration has been a theme of the new cycle. A smaller number of funds are deploying at larger sizes into fewer startups in, an increasing share of which are located in Silicon Valley, and nearly all of them are “AI-related.”

There is one sense, however, in which all that concentration is a bit misleading. Beneath the surface, there has been a mix-shift in the kinds of companies that are being funded. Venture dollars are flowing to enterprise software and consumer apps, as they always have, but also traditionally out-of-scope services (e.g. legal, accounting) and formally less-popular capital-intensive verticals, like semis, power, and defense.
